

## Course Syllabus: Applied Mathematics II - AMCS 202

<b>Division</b>	Computer, Electrical and Mathematical Sciences & Engineering
<b>Course Number</b>	AMCS 202
<b>Course Title</b>	Applied Mathematics II
<b>Academic Semester</b>	Spring
<b>Academic Year</b>	2016/2017
<b>Semester Start Date</b>	01/22/2017
<b>Semester End Date</b>	05/18/2017
<b>Class Schedule</b> (Days & Time)	04:00 PM - 05:30 PM   Sun Thu

### Course Information

<b>Comprehensive Course Description</b>	<p>This course is part of a fast-paced two-course sequence in graduate applied mathematics with emphasis on analytical techniques.</p> <p>Review of complex functions. Analyticity, the Cauchy-Riemann equations. Conformal maps. Applications to fluid flows. Contour integrals. The Cauchy-Goursat theorem, the Cauchy integral formula. Taylor series, singularities, Laurent series. Classification of isolated singularities. Residues and their applications.</p> <p>Fourier and Laplace integrals and transforms. Applications to ordinary and partial differential equations (ODEs and PDEs).</p> <p>Review of linear algebra. Bases, independence. Linear maps, null space, rank, eigenvalues, inner product, norm, condition number. Functions of matrices. Numerical methods for linear algebra problems. Gaussian elimination, LU decomposition. Projections, Gram-Schmidt orthogonalization, and the method of least squares.</p>
<b>Course Description from Program Guide</b>	<p>Prerequisites: Advanced and multivariate calculus and elementary complex variables. AMCS 201 and 202 may be taken separately or in either order. Part of a fast-paced two (2)-course sequence in graduate applied mathematics for engineers and scientists, with an emphasis on analytical technique. A review of linear spaces (basis, independence, null space and rank, condition number, inner product, norm, and Gram-Schmidt orthogonalization) in the context of direct and iterative methods for the solution of linear systems of equations arising in engineering applications. Projections and least squares. Eigenanalysis, diagonalization, and functions of matrices. Complex analysis, Cauchy- Riemann conditions, Cauchy integral theorem, residue theorem, Taylor and Laurent series, contour integration, and conformal mapping. No degree credit for AMCS majors.</p>

<b>Goals and Objectives</b>	In the first part of the course we consider various applications of complex integrals (residues and the computation of improper integrals). In the second part we apply the Fourier and Laplace transforms to solve certain linear ODEs or PDEs. In the third part of the course we study some numerical methods to solve systems of linear algebraic equations.
<b>Required Knowledge</b>	Advanced and multivariate calculus and elementary complex variables
<b>Reference Texts</b>	D. G. Zill, M. R. Cullen: Advanced Engineering Mathematics (3rd edition, 2006) E. Kreyszig: Advanced Engineering Mathematics (9th edition, 2006) J. W. Brown, R. V. Churchill: Complex Variables and Applications (9th edition) G. Strang: Linear Algebra and its Applications (4th edition)
<b>Method of evaluation</b>	<b>26.00%</b> - Final exam <b>24.00%</b> - Homework /Assignments <b>25.00%</b> - Exam 2 <b>25.00%</b> - Exam 1
<b>Nature of the assignments</b>	There will be 8 homework assignments during the semester; the students should work out the details of the problems individually. During the course there will be two midterm exams and a final exam; all exams are closed-note, closed-book exams, however, a handwritten formula sheet of size A4 can be used. At the end of the course, a standard letter grade is obtained.
<b>Course Policies</b>	Students are expected to attend all classes and exams. They are required to submit every assignment on time. Incomplete grade (I) for the course will only be given under extraordinary circumstances (such as sickness).
<b>Additional Information</b>	Students taking this course as AMCS 202 will obtain standard letter grades (A-F). Students taking this course as AMCS 153 will obtain S or U grades.

### Tentative Course Schedule

*(Time, topic/emphasis & resources)*

Week/Lecture	Topic
1	Analytic functions. The Cauchy-Riemann equations
2	Harmonic functions
3	Conformal maps. Möbius transformations
4	Conformal maps. Applications to fluid flows. 1st midterm
5	Contour integrals. The Cauchy-Goursat theorem
6	Contour integrals. Cauchy's integral formulae
7	Taylor series. Laurent series. Classification of isolated singularities
8	The residue theorem. Applications: evaluating real improper or trigonometric integrals
9	Applications: evaluating real improper or trigonometric integrals. 2nd midterm
10	Fourier and Laplace integrals and transforms
11	Fourier and Laplace integrals and transforms. Applications to ordinary and partial differential equations
12	Review of linear algebra. Bases, independence. Linear maps, null space, rank, eigenvalues, inner product, norm, condition number
13	Analytic functions of matrices (exp, sin, cos, log). Gaussian elimination, LU decomposition
14	Projections, Gram-Schmidt orthogonalization, and the method of least squares
15	Final exam
16	
17	
18
