Course Information	
Comprehensive Course Description	The course covers basic optics and spectroscopy, optical microscopy techniques, advanced fluorescence microscopy, and single-molecule imaging techniques. The course also introduces label-free optical imaging methods including Raman and infrared microscopy, and holographic microscopy. Introduction to advanced methods for manipulation of single cells and single molecules (optical and magnetic tweezers), correlative light and transmission/scanning electron microscopy (TEM and SEM) an <i>in situ</i> liquid TEM will be also provided. Students also present an assigned paper that is related to imaging/microscopy.
Course Description from Program Guide	This course provides a comprehensive overview of bioimaging techniques including fundamental concepts and applications, which allow biology students to design imaging experiments for their own research.
